Profile

Italian software engineer based in London with a strong focus on identity systems and secure architectures. Background across Windows, Linux and Android environments, working on real-world systems involving authentication, device control and distributed platforms. Comfortable moving across the full stack, from low-level debugging to system design and deployment.

Work Experience

Identity and Access Management (IAM) SSO (Kerberos, GSSAPI), Active Directory (Samba AD), JWT token-based authentication, identity propagation, authentication vs authorisation, session handling, secure API access, identity-driven access control, Zero Trust principles, least privilege, service principals (SPN), keytabs, cross-platform identity flows (Windows/Linux/Android), FastAPI-based identity services.

Android Enterprise and Device Management Kotlin, Kiosk mode, LockTask, restricted environments, permission control, device policy patterns, foreground services, remote device management, RSA-based authentication, secure command execution, system-level behaviour, networking, Bluetooth integration, secure device access control.

Reverse Engineering and Screen Casting Systems Protocol analysis, reverse engineering of Apple/Android casting behaviours, cross-platform screen casting (iOS Android, Windows Android), network-level debugging, media streaming flows, service interaction analysis, interoperability challenges.

Distributed Systems and Digital Signage LAN-based distributed architecture, decentralised control models, content distribution, system resilience without central cloud dependency, performance optimisation, trade-offs between compiled (Rust) and interpreted (Python) systems.

Interactive Systems and Machine Learning Interactive whiteboard systems, handwriting recognition, TensorFlow integration, real-time input processing, user interaction modelling.
