

# Daniele Della Cioppa

Identity and Access Management Engineer  
London, UK

## Profile

---

Italian software engineer based in London with a strong focus on identity systems and secure architectures. Background across Windows, Linux and Android environments, working on real-world systems involving authentication, device control and distributed platforms. Comfortable moving across the full stack, from low-level debugging to system design and deployment.

## Work Experience

---

**2025–2026**  
**Current**

### **Identity and Access Management, Kerberos SSO and Token-Based Access**

Custom Windows SSO bridge; Kerberos; GSSAPI; Active Directory concepts; Samba AD lab; domain-joined Windows clients; SPN; keytabs; JWT generation/validation; JWKS concepts; FastAPI identity services; authentication vs authorisation; identity propagation; Zero Trust; least privilege; secure backend and file-server access; user-to-resource identity mapping; Windows/Linux integration.

**2024–2025**

### **Distributed Digital Signage and Device Synchronisation**

LAN-based distributed architecture; device-to-device coordination; content distribution; local-first control model; resilience beyond central cloud dependency; multi-device synchronisation; remote content management; performance considerations; Python service prototypes; Rust exploration for faster compiled services.

**2023–2024**

### **Remote MDM, APK Repository and Update Infrastructure**

Remote device-management concepts; Android MDM-style control; repository server for APK delivery; compensation strategy for non-updatable base OS; APK hosting; update metadata; hash verification; SHA-512; RSA authentication; secure command execution; remote control APIs; configuration management; foreground services; server/client architecture; Android + Python/Kotlin services.

**2022–2023**

### **Android Enterprise Kiosk, LockTask and Secure Device Configuration**

Android development; Kotlin; kiosk mode; LockTask mode; restricted environments; controls for Bluetooth/Ethernet/tethering/sensitive settings; selectable LockTask profiles; per-user and per-profile configuration; USB-key configuration access; in-house cryptographic certificate and RSA-style access control; unique device ID + key binding; unauthorised-change prevention; secure lockdown; system-level behaviour; permission control; high-security controlled environments.

**2021–2022**

### **GPS Streetlight Monitoring, IoT Nodes and Gateway Systems**

GPS streetlight monitoring; IoT nodes and gateways; UMTS connectivity; PostgreSQL database; Android visualisation app; streetlight and battery monitoring; fault detection; remote telemetry; device status reporting; gateway-to-database communication; early distributed field-system experience.
